

ROTATION PROGRAM

BAIT ROTATION IS VITAL TO SUCCESSFUL, LONG-TERM RODENT CONTROL

Rodents may develop tolerances to baits if they are constantly exposed to the same active ingredient. To avoid this, implement a bait rotation program that utilizes baits with multiple active ingredients, including at least one non-anticoagulant rodenticide.

Hawk can be used throughout the year for up to 6 months to maintain control. Its palatable formula is attractive to rodents regardless of the competitive food sources that may be available.

Jaguar should be used as your second anticoagulant formulation. Its powerful active ingredient (Brodifacoum) ensures that even the most finicky rodents are taken out. Plan to include in your rotation for at least 4 months.

Use Rampage during peak rodent pressures and/or when you see populations spike. This acute, non-anticoagulant rodenticide will knockdown populations and take out any potentially anticoagulant resistant Norway rats. Use for at least 2 months at a time.
